As the name "FLEXA" suggests, this foil is used to produce flexible packaging solutions like blisters that can be folded, bent, or twisted.

- Patient-friendly
- Child-resistant features
- Personalization and serialization on primary packaging
- Convenient on-the-go use

Perfect for on-the-go use.

What is FLEXA?

At Constantia Flexibles, we strive to make life easier not only for our customers, but for theirs as well. So, when we explored new ideas for single-dose oral delivery, making it more user-friendly was a top priority. The result is FLEXA, an innovative packaging solution that combines the best of all worlds: the easy push-through action of a blister, the pleasant look and feel of a flexible strip pack, and the superior barrier properties our products are known for. Manufacturers find it user-friendly, too – FLEXA is a “drop-in” technology for use on existing strip pack lines with no modifications.

Why use FLEXA?

Thanks to its unique design, FLEXA is resistant, comfortable, and easy to wear. The convenient push-through opening operates just like a conventional blister, but without the use of eco-unfriendly PVC and chlorine. Our application team can modify the push-through force needed to access the product for everything from child-resistant to easy-to-open solutions. Because this mechanism only works from back to front, the product information printed on the primary packaging will not be damaged by opening individual cavities. FLEXA also offers an easy tear mechanism to separate individual cavities or groups of tablets, with specific information (day, color, expiration, dose, etc.) digitally printed on each cavity – an important asset for treatments in which the dose varies from one tablet to another. Additional personalization and serialization options on the primary packaging round off the range, making FLEXA a highly versatile packaging solution.

Full flexibility – also regarding your required needs.

Where to use it?

This packaging solution is suitable for:

- pharmaceutical oral dosage forms such as pills and tablets, and
- on-the-go use (pocket- and bag-friendly).

What should first-time users know?

Constantia Flexibles offers personalized service for first-time users of FLEXA, ensuring close collaboration with clients until production is running smoothly and as designed. Contact our product development and application team to find the ideal solution for your individual needs, whether it is adapting to different specifications, tablet sizes, and shapes, or incorporating anti-counterfeiting, child-resistant, and easy-to-open features.

And the specifications?

Easy-to-open features

Various possible materials available on the front and back, e.g., PET 12 µm / extruded LDPE 12 g / ALU 9 µm / ionomer 23 g

APERTA* can be added to the front

Child-resistant features

Various modifications depending on customer requirements and regional regulations. To learn more about the available options, get in touch with our dedicated team.

*APERTA (formerly TOF) is an opening feature that uses microperforation to weaken the PET film without compromising the barrier properties (no damage to the aluminum layer). While easy to open for seniors, APERTA is difficult for children to open due to the push-through force required – which we can naturally modify to your specifications.

FLEXA is the perfect packaging for on-the-go use.
